APNA DIGITAL SERVICE

Website Development Plan

Implementation instructions for developer / AI coding agent

Revised workflow: NO online payment integration

Project item	Decision / instruction
Business	Apna Digital Service — private digital documentation assistance platform
Domain	www.apnadigitalservice.com
Branding	Use client-provided logo; saffron orange, India green, white/off-white and dark navy/charcoal text
Core workflow	Customer submits a request on the website; Super Admin manually checks the corresponding Google Form response sheet and updates status
Payment	Do not build a payment gateway, payment checkout, payment confirmation automation, or transaction ledger
Proposed stack	React frontend on Cloudflare Pages; Supabase Auth + PostgreSQL + Row Level Security; Cloudinary for uploaded result files
Document purpose	Build instructions. Confirm any scope or budget changes in writing before implementation.

1. Project goal

Build a responsive website for Apna Digital Service where customers can learn about seven services, create an account, submit a service request, view their request status, and download a result/receipt file uploaded by the Super Admin. The operations team will manually verify Google Form submissions using the Google Forms response spreadsheets. The website must not attempt to detect Google Form submissions automatically.

- The website is a private business platform, not a government website or official portal.
- Do not imply government affiliation, guarantee approval, or promise a fixed processing time.
- Collect only the information required for the selected service. Sensitive identity details and documents must be protected with strict access controls.
- Do not build online payment integration. Remove payment checkout, payment status, transaction records, payment callbacks, and payment-related dashboard logic.

2. Important scope rules

The client requirements brief lists seven service pages, multiple policy/content pages, service-specific forms, customer/admin dashboards and additional admin controls. The earlier ₹7,000 proposal described a narrower scope, including six Google Forms and a specific admin workflow. This plan records the requested product behaviour, but it does not automatically change the signed/accepted price or proposal.

Decision	Implementation instruction
Payment integration	Excluded completely, as requested.
Google Forms	Keep external Google Forms as the service-specific detail/submission step. No API, Apps Script, prefilled Application ID, automated response matching or automatic submission detection.
Website request form	Build a normal website form that creates a request record with customer name, email, phone, selected service and any agreed short request notes. The website creates its own unique Application ID.
Manual verification	Super Admin opens the relevant Google Forms response spreadsheet, searches manually using customer details, and updates status in the website.
Service count	Client brief lists seven services. Confirm that all seven pages are required. Existing brief only lists four spreadsheet links, so the owner must provide/confirm the remaining relevant form links.
Customer uploads	The brief mentions customer-side uploads, but the earlier proposal only clearly describes Super Admin

	uploading a completed file. Confirm whether customer document uploads are required before building that feature.
Legal/policy pages	Client brief supplies draft content. Owner must approve the final wording, refund policy, data handling and any applicable legal requirements before publishing.
Out-of-scope extras	Custom animation, automated email/SMS/WhatsApp notifications, additional document retention/deletion workflows and other unspecified integrations require confirmation and may require a revised quote.

3. Services to display

#	Service	Required page behaviour
1	Voter ID / e-EPIC PDF Download Assistance	Customer submits a website request, then uses the linked external form if required. Team manually checks the response sheet.
2	PAN Card PDF Download Assistance	Same overall workflow; collect only the fields confirmed as necessary by the business owner.
3	Driving Licence (DL) PDF Download Assistance	Same overall workflow; collect only the fields confirmed as necessary by the business owner.
4	Vehicle Registration Certificate (RC) PDF Download Assistance	Same overall workflow; collect only the fields confirmed as necessary by the business owner.
5	Ayushman Card — New Member Addition Assistance	Describe eligibility and supporting information requirements; never guarantee addition or approval.
6	Ayushman Card — Correction Assistance	Customer must specify the correction requested; result depends on verification and the authorized process.
7	Ayushman Card — e-KYC Assistance	Explain that OTP/biometric/other verification may be required through the applicable authorized process; do not collect or store OTPs.

4. Pages and navigation

Page	Content / behaviour
Home	Hero headline “Digital Services, Made Simple.”; subheadline explaining online request submission and backend assistance; Explore Services and Submit a Request buttons; private-platform disclaimer; service cards; short How It Works section; support details.
Services listing	Show all seven service cards with title, short description, requirements summary and View Service action.
Individual service detail (7 pages)	Show service description, eligibility/requirements, steps, disclaimer, relevant external Google Form link, and Submit Request action. Never show an unconfirmed or placeholder form URL.
Register / Login / Reset password	Supabase Auth. Prefer email verification and password reset. Never store plaintext passwords.
Customer dashboard	Show only the logged-in customer's applications, Application ID, service, submission date, current status and available result/receipt download.
Application detail	Show request information, status timeline/history if implemented, support contact, and any file made available by the Super Admin.
Admin dashboard	List all requests with filters/search by Application ID, customer name/email, service, date and status. Admin is read-only unless the owner approves a different permission.
Super Admin dashboard	All Admin capabilities plus status updates, service/form-link management if included, and uploading/replacing/removing a result or receipt file for a specific application.
How It Works	Explain service selection, website request, external Google Form submission where applicable, manual review, status tracking and result delivery. Do not mention payment checkout.
FAQ	Use client-provided FAQ content, removing payment-specific questions or rewriting them so they do not imply online payment functionality.
Contact Us	Support numbers 8018246567 / 9124494239; every day 9:00 AM–9:00 PM; support topics and instruction not to send passwords or OTPs.
Privacy Policy	Use client-provided draft as a starting point; update it to match actual data collection, Supabase, Cloudinary, manual operations and retention. Obtain client approval.
Terms & Conditions	Use client draft as a starting point; keep private-platform disclaimer and no-guarantee wording; remove payment processing statements that no longer apply.
Refund & Cancellation Policy	Client must approve the final policy. Since no payment gateway is integrated, do not represent that refunds are automatically processed by the website.
Service Disclaimer	State the business is private, not an official government portal; services depend on eligibility, verification and authorized-system availability; no guaranteed approval.
404 / access denied / empty states	Provide clear, branded messages without leaking customer data.

5. Customer workflow (exact)

1. Customer opens the website and chooses a service.
2. Customer signs in or creates an account.
3. Customer opens the service page, reads the requirements and disclaimer, then submits the website request form.
4. The website validates the fields, saves the request in Supabase, creates a unique Application ID (for example, AARYAV-APP-000123), and sets the initial status to “Request Received”.
5. The confirmation screen shows the Application ID and tells the customer to complete the linked external Google Form if the service requires it. The customer can open the external form separately.
6. The website does not know whether the external Google Form was submitted. Do not build automatic detection, response-sheet API access, Apps Script, or ID-prefilling.
7. Customer can sign in later to see the request and its current status.
8. When processing is complete, the Super Admin uploads the relevant PDF/image to the application record. The customer can access/download only their own file.

6. Manual Google Forms verification workflow

9. Each service page must use the correct responder URL supplied and approved by the business owner.
10. The Super Admin opens the relevant Google Forms response spreadsheet using the business owner's authorized Google account.
11. The Super Admin manually searches the responses using the customer name, email and/or phone number recorded in the website request. No automatic matching is performed.
12. If the response cannot be found, the Super Admin can leave the status as “Awaiting Form Verification” and contact the customer using the website's recorded contact details.
13. After manual verification, the Super Admin updates the website status, for example: “Awaiting Form Verification”, “Under Review”, “Additional Information Required”, “Processing”, “Completed” or “Unable to Process”.
14. When marking a request completed, the Super Admin uploads the result/receipt file to that exact application record and confirms the customer can access it.
15. Do not ask the customer to provide passwords or OTPs. Do not store OTPs. Handle identity documents only when genuinely needed and authorized.

Operational limitation: because Google Form responses are checked manually and no unique Application ID is passed into the external form, duplicate names or missing contact details may make matching difficult. Make the website's name, email and phone fields consistent, and require the Super Admin to verify more than one detail where possible.

7. Request statuses

Status	Meaning / who sets it
Request Received	Set automatically when the website request is saved.
Awaiting Form Verification	Super Admin is yet to find/verify the customer's external Google Form response.
Under Review	Super Admin has found the response and is reviewing the request.
Additional Information Required	More information or customer action is needed; Super Admin updates status manually.
Processing	Request is being handled through the applicable authorized process.
Completed	Work is complete and the result file has been uploaded, where applicable.
Unable to Process	Request cannot be completed; Super Admin should record a brief, appropriate reason without exposing sensitive details.

8. Admin roles and permissions

Action	Customer	Admin	Super Admin
View own application	Yes	No, unless specifically authorized	Yes
View all applications	No	Yes	Yes
Change application status	No	No (read-only role)	Yes
Upload/replace/delete result file	No	No	Yes
Manage services and Google Form URLs	No	No by default	Yes, if this feature is approved
Manage roles / create admin accounts	No	No	Restricted to authorized Super

			Admin
Read other customers' private files	No	No by default	Only where needed for processing

Use role-based access control enforced in Supabase policies and any privileged server-side functions. Hiding a button in the frontend is not security. Confirm exact admin emails before provisioning accounts. Never hard-code credentials in source code or share passwords in project documents.

9. Recommended technical architecture

Component	Purpose / rules
React frontend + Cloudflare Pages	Responsive public pages, authentication screens, customer dashboard and admin UI. Keep frontend environment variables limited to public configuration only.
Supabase Auth	Customer sign-up/login, session handling, password reset and user identity.
Supabase PostgreSQL	Store user profiles/roles, services, requests, status history and document metadata.
Supabase Row Level Security (RLS)	Customers can select only their own requests and document metadata. Admins have read-only access to all requests. Super Admin-only mutations must be protected by policies and/or server-side Edge Functions.
Supabase Edge Functions (where needed)	Use for privileged operations such as checking role permissions or generating a short-lived private file URL. Keep service-role keys only in server-side secrets.
Cloudinary	Store Super Admin-uploaded result/receipt files. Use private/authenticated delivery or signed, short-lived access. Do not expose permanent public URLs for identity-related files.
Google Forms / Sheets	External manual process only. No integration/API, automatic submission detection, prefilled Application ID or status synchronization.

10. Suggested database design

Table	Key fields	Notes
profiles	id (auth user ID), full_name, email, phone, role, created_at	Roles: customer, admin, super_admin. Role changes must be restricted.
services	id, slug, name, description, requirements, form_url, is_active, display_order, created_at, updated_at	Use only owner-approved URLs. If service management is not in scope, seed these values instead of building an editor.
service_requests	id, application_id, user_id, service_id, customer_name, customer_email, customer_phone, request_notes, status, created_at, updated_at	Application ID generated by the website; unique database constraint. Do not store unnecessary sensitive identity details.
request_status_history	id, request_id, old_status, new_status, changed_by, note, created_at	Optional but recommended audit trail for Super Admin status changes.
request_documents	id, request_id, cloudinary_public_id, secure_url/reference, original_filename, mime_type, uploaded_by, created_at	Store only safe metadata. Avoid making the file publicly accessible. Use the Cloudinary public ID to manage replacement/deletion.

11. Security requirements (must implement)

- Enable RLS on all tables containing customer data. Default-deny access and add only the policies needed for each role.
- Customer policies must restrict request rows to auth.uid() = user_id. Customers must not be able to change their own role, status, Application ID or uploaded document metadata.
- Only Super Admin can update statuses and manage result files. Admin role is read-only.
- Never put Supabase service-role keys, Cloudinary API secrets or other private keys in frontend code, browser storage, Git repositories or client-visible configuration.
- Validate all input on the server/database boundary as well as in the frontend. Enforce allowed status values and maximum lengths.
- Restrict upload file types to PDF, JPG/JPEG and PNG unless the owner approves more; enforce file-size limits; reject executable files.
- Keep result files private and use authenticated delivery or short-lived signed URLs. Verify that the requesting customer owns the associated application before providing access.

- Avoid putting PAN, DL, voter or other sensitive identification details in URLs, logs, analytics or error messages.
- Do not collect or store passwords for government systems, OTPs, or biometric data.
- Test cross-account access by logging in as Customer A and attempting to open Customer B's request and file. Access must be denied.
- Keep audit records for Super Admin status changes and document actions where feasible.
- Agree retention/deletion periods with the business owner before launch; do not invent a retention promise.

12. UI / visual design instructions

- Use the supplied Apna Digital Service logo as the primary branding reference.
- Palette: saffron orange, India green, white/off-white and dark navy/charcoal text. Use tricolour-inspired accents only; do not use the full national flag as a decorative background.
- Do not use government emblems or visual design that implies official government affiliation.
- Use a clean, professional, modern layout with readable typography, clear forms, generous spacing and mobile-first responsive behaviour.
- Avoid excessive gradients, heavy shadows and unnecessary decoration.
- Service cards and buttons must be consistent across the home page and service pages.
- Show loading, success, validation, empty, error and access-denied states. A custom animated loading ring is optional and should only be built if explicitly approved.
- Ensure keyboard navigation, visible focus states, labels for form fields, sufficient contrast and mobile-friendly controls.

13. Content and policy instructions

- Use the supplied client brief as the source for service descriptions, FAQ, About, How It Works and contact details.
- The website must clearly state: Apna Digital Service is privately operated and is not a government website, government department or official government portal.
- Do not promise approval, issuance, correction, e-KYC success or fixed processing times.
- Remove or revise all statements that imply website checkout, payment gateway, online payment confirmation, transaction history or payment-triggered request creation.
- Keep payment-specific FAQ items out of the live site or rewrite them to direct customers to support for any separately agreed offline payment process. Do not imply an online payment feature exists.
- The owner must approve final Privacy Policy, Terms & Conditions, Refund & Cancellation Policy and Service Disclaimer before publishing. This plan is not legal advice.
- Support details from the brief: 8018246567 / 9124494239; every day, 9:00 AM–9:00 PM. Confirm these details before launch.

14. Form fields

Website request form — minimum fields:

- Selected service (preselected from service page and not editable to an unrelated service).
- Customer full name.
- Customer email address (prefill from account where possible).
- Customer mobile number.
- Short request note, if needed; do not collect sensitive identity details here unless the owner has approved the exact fields and secure handling.
- Acknowledgement checkbox confirming the customer has read the private-platform disclaimer and understands that submission does not guarantee approval.

External Google Forms: keep each client-provided Google Form as a separate external step. Do not add an Application ID solely for tracking. The website request record is independent from the Google Form response. The Super Admin manually checks the spreadsheet using customer details.

15. File upload and delivery workflow

16. Super Admin opens a specific application and chooses Upload Result/Receipt.
17. The system validates the file type and size, uploads it securely to Cloudinary, and saves the associated file metadata against the correct request.
18. If replacing a file, make the new file available first, update metadata, then remove the old asset only after confirming the update succeeded.
19. Customer dashboard shows a Download/View Document action only when a document exists and the customer owns that request.
20. Never list Cloudinary assets publicly or allow customers to guess a URL to access another customer's document.
21. If customer-side uploads are required, treat this as a separate confirmed feature and apply the same private-file controls.

16. Search, filters and operational usability

- Admin/Super Admin request table: search by Application ID, customer name, email or phone; filter by service, status and date; paginate large result sets.
- Request detail view should show contact details, service, request timestamp, Application ID, current status, status history (if enabled), the external Google Form link and result-file state.
- The Google Form link is for the Super Admin's manual review workflow. The website must not display private response spreadsheet URLs to customers.
- If a request cannot be matched to a Google Form response, show a manual “Awaiting Form Verification” status rather than claiming the form was or was not submitted.

17. Build sequence / implementation phases

Phase	Work to complete
Phase 1 — Confirm inputs	Obtain logo/assets, final seven service descriptions, all responder URLs, admin email addresses, final policies, exact form fields and approval of any features outside the proposal.
Phase 2 — Project foundation	Create React project, responsive layout, environment configuration, Cloudflare Pages setup, Supabase project and development/production separation where feasible.
Phase 3 — Database and access rules	Create tables, unique Application ID generation, role model, RLS policies and initial seed services. Test policies before building the admin UI.
Phase 4 — Public website	Build home page, service listing, seven service detail pages, How It Works, FAQ, Contact Us and approved policy pages.
Phase 5 — Authentication and customer flow	Build sign-up/login/reset password, request submission, confirmation with Application ID and customer dashboard showing only own requests.
Phase 6 — Admin workflow	Build read-only Admin list/detail screens; build Super Admin status updates, manual verification notes and result-file upload/replace/delete.
Phase 7 — Cloudinary security	Configure secure uploads and short-lived/private delivery; test correct file-to-request association and customer authorization.
Phase 8 — Responsive polish	Test mobile, tablet and desktop; loading/error/empty states, accessibility and performance.
Phase 9 — QA and launch	Run role tests, cross-customer isolation tests, file access tests, form validation, production deployment, owner acceptance and handover.

18. Testing checklist before launch

- ☐ A new customer can register, log in and reset their password.
- ☐ A customer can submit a website request and receives a unique Application ID.
- ☐ A customer's dashboard shows only that customer's requests.
- ☐ A customer cannot edit their role, status, Application ID or another customer's request.
- ☐ Admin can view the authorized request list but cannot change status or upload/delete files.
- ☐ Super Admin can manually update status and upload/replace/remove a file.
- ☐ The right customer can download their own file; another customer cannot access it even with a copied URL.
- ☐ Each of the seven service pages has the correct approved form link and no placeholder link.
- ☐ The external Google Form workflow is clearly described as manual verification; no automation is claimed.

- ☐ No payment gateway, checkout, payment confirmation, payment transaction table or payment-dependent workflow is present.
- ☐ Policy/footer links work and policy text is approved by the business owner.
- ☐ The private-platform disclaimer is visible in suitable locations.
- ☐ Mobile/tablet/desktop layouts, validation messages and error states work.
- ☐ Production secrets are not exposed in frontend bundles or Git.
- ☐ The owner has tested the site and approved the final version.

19. Client inputs required before development is considered complete

- Confirm the final list of seven services and whether all seven are included in the agreed price.
- Provide/confirm the correct responder URL for every service. The supplied brief currently lists four spreadsheet URLs, not seven complete responder links.
- Confirm whether the website needs customer-side document uploads. The previous proposal only clearly describes Super Admin uploading the completed file.
- Provide Super Admin email and all Admin email addresses. The brief lists help.apnadigitalservice@gmail.com for Super Admin and leaves Admin details pending.
- Provide the logo and any approved images.
- Approve the fields collected on each service request and each external Google Form.
- Approve final policy wording, refund terms, support numbers/hours, and data retention/deletion practices.
- Confirm whether service fee/availability editing, status notifications, custom loading animation and a status-history timeline are included or excluded.
- Confirm the revised feature scope and price in writing if it differs from the original ₹7,000 proposal.

20. Final developer instruction

Build the website around a secure, website-native request record and customer dashboard. Google Forms are external and checked manually by the Super Admin; there is no Google Forms tracking or automatic matching. Do not implement online payment integration in any form. Do not expose private documents or customer data. Use the client brief for content and branding, but stop and ask for clarification rather than inventing missing form URLs, admin details, policy terms or unapproved functionality. Keep a clear record of any feature that changes the agreed scope or price.
